

FDE Centrifugal Fan Series

Model Nos.: FDE

The Seacon centrifugal fan are the result of long experience in the development and manufacturing of ventilation systems. The partnership between highly motivated Seacon employees and world known component suppliers guarantees quality products on the highest technical level and precise reliability.

The Seacon advantage:

- Easy electrical connection
- Easy installation
- Impellers and casings made of galvanized steel or coated steel
- High efficiency & economic
- Can also be operated in polluted air without problems
- Low noise & quiet running
- Application flexibility

The Seacon quality:

The Seacon belt driven centrifugal fans are driven by high eficiency IEC motor class IP 55, insulation class be F or H Motor and impeller are statically & dynamically balanced in two levels according to VDI 2060.

Ball or Roller bearing can be easily replaced. Lti uses the bearing lift of L10 type.

The casing and impeller can be make of stainless steel or be coated with epoxy paint upon request.

The Seacon ranges:

Standard execution complete with outlet lange and mounting feet, baseframe, belt and belt guard.

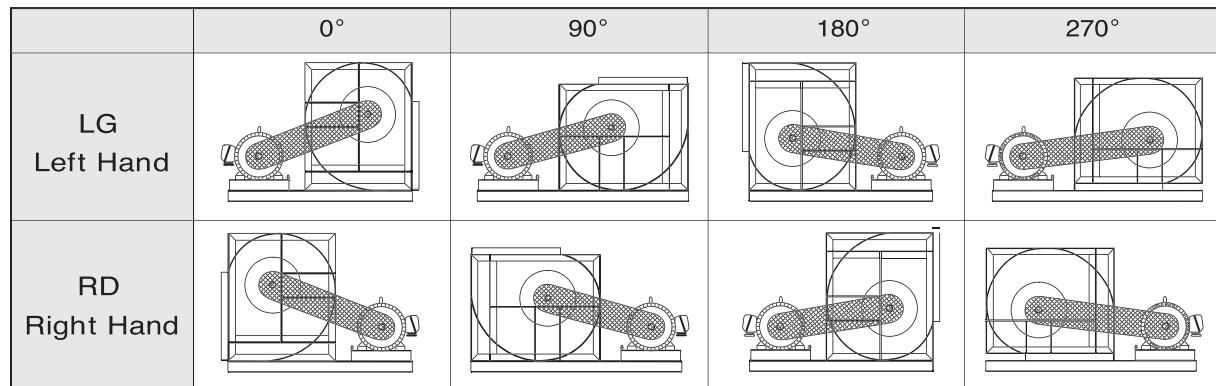

Type of Product

1. Direction of Rotation

Ventilator can be divided into two direction of rotations, left-hand rotation(LG) and right hand rotation (RD); Viewing from end of motor outlet line, if the impeller rotates clockwise, it is called right hand ventilator; If the impeller rotates anti-clockwise, it is called left hand ventilator.

2. Direction of Air Outlet

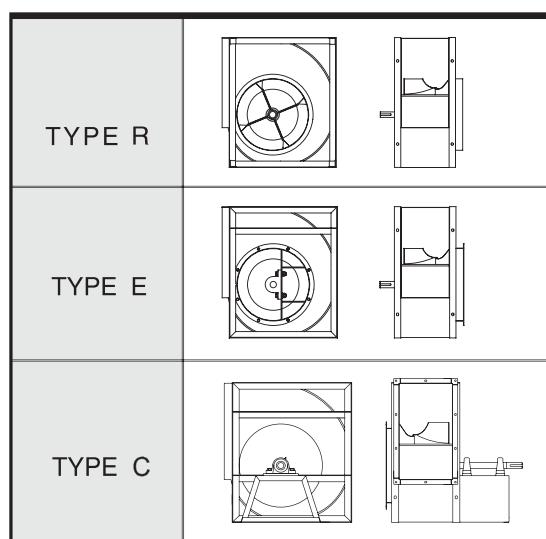

According to Fig 1 , Ventilator can be made in four air-outlet directions: 0° , 90° , 180° , and 270° .

(Fig1)

3. Type of structure

According to Fig 2, Ventilators can be divided into Category R, Category E and Category C.

(Fig2)

Construction of Product

Ventilators are mainly consisted of scroll, impeller, frame bearing, Shaft, outlet flange.

1). Scroll

The scroll is made of hot galvanizing steel sheet. Its side plate has an outline complying with aerodynamics. The scroll plat fixed to the side plates by means of "electric spot welding".

2). Impeller

For wards curved radial impellers the impeller is made of high grade hot galvanizing steel sheet and is designed to a special configuration according to aerodynamics to make the efficiency highest and the noise lowest. The impeller is fixed on the middle disk plate and on the end ring with riveting grippers. The impeller has enough rigidity during continuous rotation with maximum power. Backwards curved radial impellers are made of high grade cold-rolled sheet. The veneer blades which are designed in three-dimensional theory are welded between middle tray and endmost. Before leaving factory, all impellers have passed all-round dynamic balance test according to the Company Standard which is higher level than National Standard.

3). Frame

The frames for type R ventilators are made of galvanized steel angle iron bars. The cutting and bending of the frame parts, as well as the TOX connections, are formed with the use of molds to assure their high accuracy and the rigidity of the frames; The frames for type E, type C ventilators are welded by angle steel and flat, steel and they are finished with polyesters coatings in order to assure sufficient rigidity and intensity.

4). Bearings

Ball bearings are used in all of the Lti centrifugal ventilators. They are high quality bearings and they are selected to minimize the ventilator noise levels. The bearings are pre-lubricated, sealed, and selfcentering. For type R ventilators, the bearings are mounted using vibration resistant washers. For type E, type C ventilators, self-aligning pillow block ball bearings are used, Type k ventilators bearings are supplied with lubrication fittings.

5. Shaft

The shafts are made of 40 Cr or C45 carbon steel bars. The shafts are rough machined and then stress relieved before final machining. The shaft diameters are machined to very accurate tolerance levels and they are fully checked to assure precision fits. They are coated after assembly in order to provide corrosion resistance. Stainless steel shaft will be used in spark protection application.

6. Inlet and Outlet Flange

The inlet flange are made of high grade cold-rolled sheet and painted with polyester coatings. The outlet flange is made of galvanized steel. The connections of the flange components to each other and to the scroll are made using a TOX non-welding process. This maintains a good flange appearance while also providing sufficient strength and rigidity.

Performance of Ventilator

1. The ventilator performance in this catalogue denotes the performance in standard conditions. It denotes air inlet conditions of ventilator as follows:

Air inlet pressure P_a = 101.325KPa

Air temperature t = 20 °C

Inlet gas density ρ = 1.2Kg/m³

If the practical air inlet conditions of customer or the speed of the operating ventilator changes, the conversion can be carried out according to the following expression:

$$\frac{Q^*}{Q_0} = \frac{n^*}{n}$$

$$\frac{P^*}{P_0} = \frac{n^{*2}}{n^2} \cdot \frac{\rho^*}{\rho} \quad \frac{P^*}{P_0} = \frac{n^{*2}}{n^2} \cdot \frac{P_a^*}{P_a} \cdot \frac{273+t^*}{273+t}$$

$$\frac{Nin^*}{Nin_0} = \frac{n^{*3}}{n^3} \cdot \frac{\rho^*}{\rho} \quad \frac{Nin^*}{Nin_0} = \frac{n^{*3}}{n^3} \cdot \frac{P_a^*}{P_a} \cdot \frac{273+t^*}{273+t}$$

where:

Volume Q (m³/h), total pressure P_0 (Pa), speed n (r/min) can be obtained from Performance chart.

Asterisk (*) on the upper right corner denotes the performance parameter needed by the customers in practical gas inlet conditions.

The difference in relative humidity is omitted from the above- mentioned formulas.

2. The power (Nin_0) on the performance chart the internal power of the ventilator.

Shaft power of ventilator: $N_s = Nin_0 / \eta_m$

where: N_s -Shaft power of ventilator

η_m -Mechanical efficiency of ventilator

The value of mechanical efficiency of ventilator can be obtained from Table 1.

Way of ventilator driving	η_m
electric motor directly driven	1
Coupling directly driven	0.98
V-belt driven	0.95

(Table1)

(2)The rated power of the drive motor equals the total required shaft input power multiplied by the safety factor:

$$N = N_s \cdot K$$

where: N = rated power of drive motor

K = required safety factor

The required safety factor is provided in Table 2.

Power of electric motor(Kw)	K值 Value k
≤2.2Kw	1.2
≤11Kw	1.15
>11Kw	1.1

(Table2)

3. Noise: The noise levels shown on each performance chart, LwiA, refer to the overall sound power "A Weighted" levels. The computed sound power levels were converted into A-Weighted levels using adjustments to the octave band spectrum as follows:

Center Frequency Hz	63	125	250	500	1000	2000	4000	8000
Weighted Adjustment dB (A)	-25.5	-12.5	-8.5	-3	0	+1	+1	-1

Table. 3

The overall sound pressure levels, LpiA, can be computed from the overall sound power levels as follows:

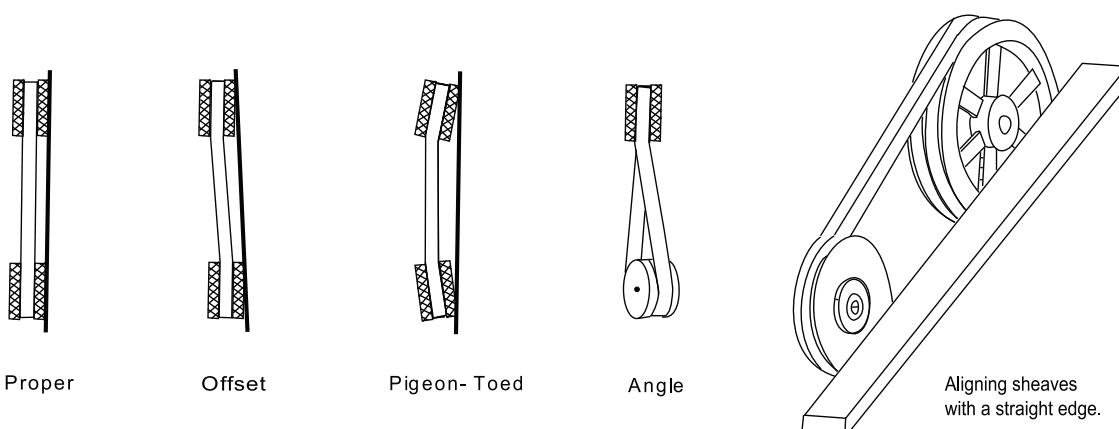

$$\text{Free Field Conditions: } LpiA = Lwia - (20 \log_{10} d) - 11$$

$$\text{Room Conditions: } LpiA = Lwia - (20 \log_{10} d) - 7$$

Where: d = distance from fan in meters.

V-BELT DRIVE INSTALLATION

1. Remove the protective coating from the ends of the fan shaft and assure that the shaft ends are free of nicks and burrs.
2. Check fan and motor shafts for parallel and angular alignment.
3. The center distance must be controlled as $0.7(d_1 + d_2) < 2(d_1 + d_2)$; the belt speed of the fan should be more than 25 m/s, but less than 35m/s, ($25 < v < 35$ m/s)
4. Slide sheaves on to the shafts - do not drive the sheaves on to the shafts as this may result in bearing damage.
5. Align fan and motor sheaves with a straight-edge or string, and tighten. as shown in Fig3.
6. Place belts over the sheaves. Do not pry or force the belts as this could result in damage to the cords within the belts.
7. Adjust the belt tension until the belts appear snug. Run the unit for a few minutes and allow the belts to set properly.
8. Switch off the fan, adjust the belt tension by moving the motor base. When in operation, the tight side of the belts should be in a straight line from sheave to sheave and there should be a slight bow on the slack side.

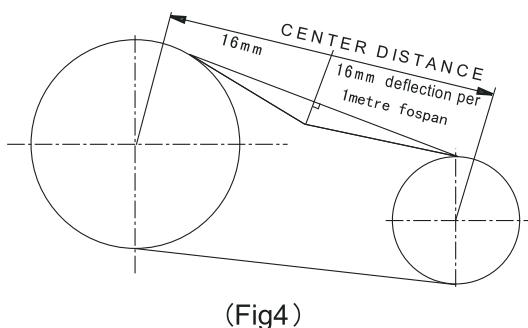

(Fig3)

Belt tension

A proper level of belt tension is required in order to obtain a satisfactory belt life. If the belt tension level is too high, then excessive loads will be imposed on the belts and the bearings, and this will reduce the lives of both of these components. If the belt tension level is too low, then the belt will slip. Belt slippage generates a large amount of heat, and this heat will drastically reduce the life of a belt. Belt-tensioning gauges can be used to determine whether the belts are tensioned properly. A chart is normally supplied with the gauge which indicates the ranges of forces required to deflect the belts by a given amount to obtain the proper belt tension level. The required forces are based upon the center distance of the sheaves and the belt cross-section. the belts are properly tensioned when the forces required to deflect the belt are within the specified range, see Fig 4 and Table 3.

If a belt-tensioning gauge is not available, then the belt should be tightened just enough so that the belt does not squeal when the ventilator is started. A very short period of noise during the starting of a ventilator is allowable, but a squeal lasting several seconds or longer is not acceptable. After tensioning the belts and before starting the ventilator, check to make sure that the sheaves are properly aligned. Realign the sheaves if necessary. Note that new belts may stretch a little during initial use, so the belt tension level should be checked after a few days of operation.

Belt tension indicator applied to mid centre distance.

(Fig4)

Belt Section	Force required to deflect belt 16mm per metre of span		
	Smallest Pulley/Diameter (mm)	牛顿	Kilogram force (Kgf)
SPZ	56-95	13-20	1.3-2.0
	100-140	20-25	2.0-2.5
SPA	80-132	25-35	2.5-3.6
	140-200	35-45	3.6-4.6
SPB	112-224	45-65	4.6-6.6
	236-315	65-85	6.6-8.7
SPC	224-335	85-115	8.7-11.7
	375-560	115-150	11.7-15.3
A	80-140	10-15	1.1-1.5
B	125-200	20-30	2.0-3.1

(Table3)

Bearing Lubrication

The ventilator bearings are filled with lubricant when they come from the factory, so the bearings do not require any additional grease to be supplied before starting the ventilator.

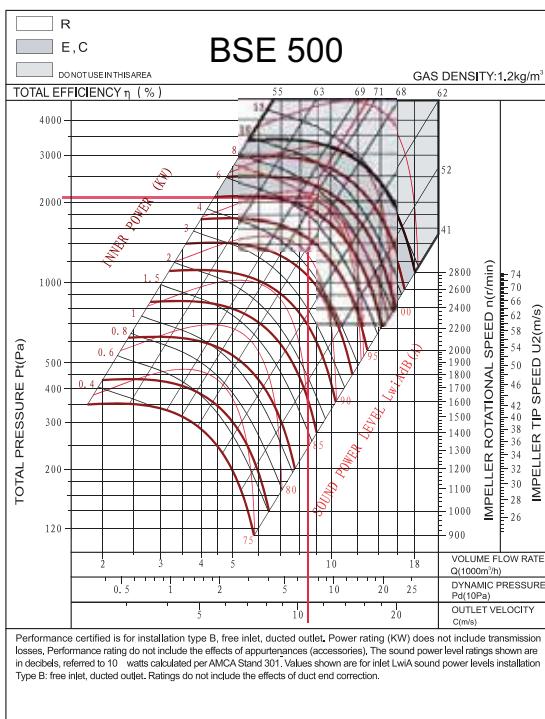

The ventilator that are equipped with pillow block bearings are provided with lubrication fittings, and these fittings allow for additional lubrication to be supplied to the bearings at regular intervals. The allowable period of time between lubrication of these bearings depends upon the operating speeds and temperatures of the bearing as well as on the type of grease used. The best way to determine the required frequency of lubrication is to inspect the condition of the grease that is discharged from the seals when new grease is added. If the discharged grease looks similar to the new grease, then a longer period of time between lubrications is possible. If the discharged grease is much darker than the new grease, then this indicates that the grease is being oxidized and more frequent lubrications of the bearings are required.

Instructions

- During ordering it is necessary to state the type of ventilator, speed, air volume, air pressure, direction of air outlet, rotating direction, type of electric motor and its specifications.

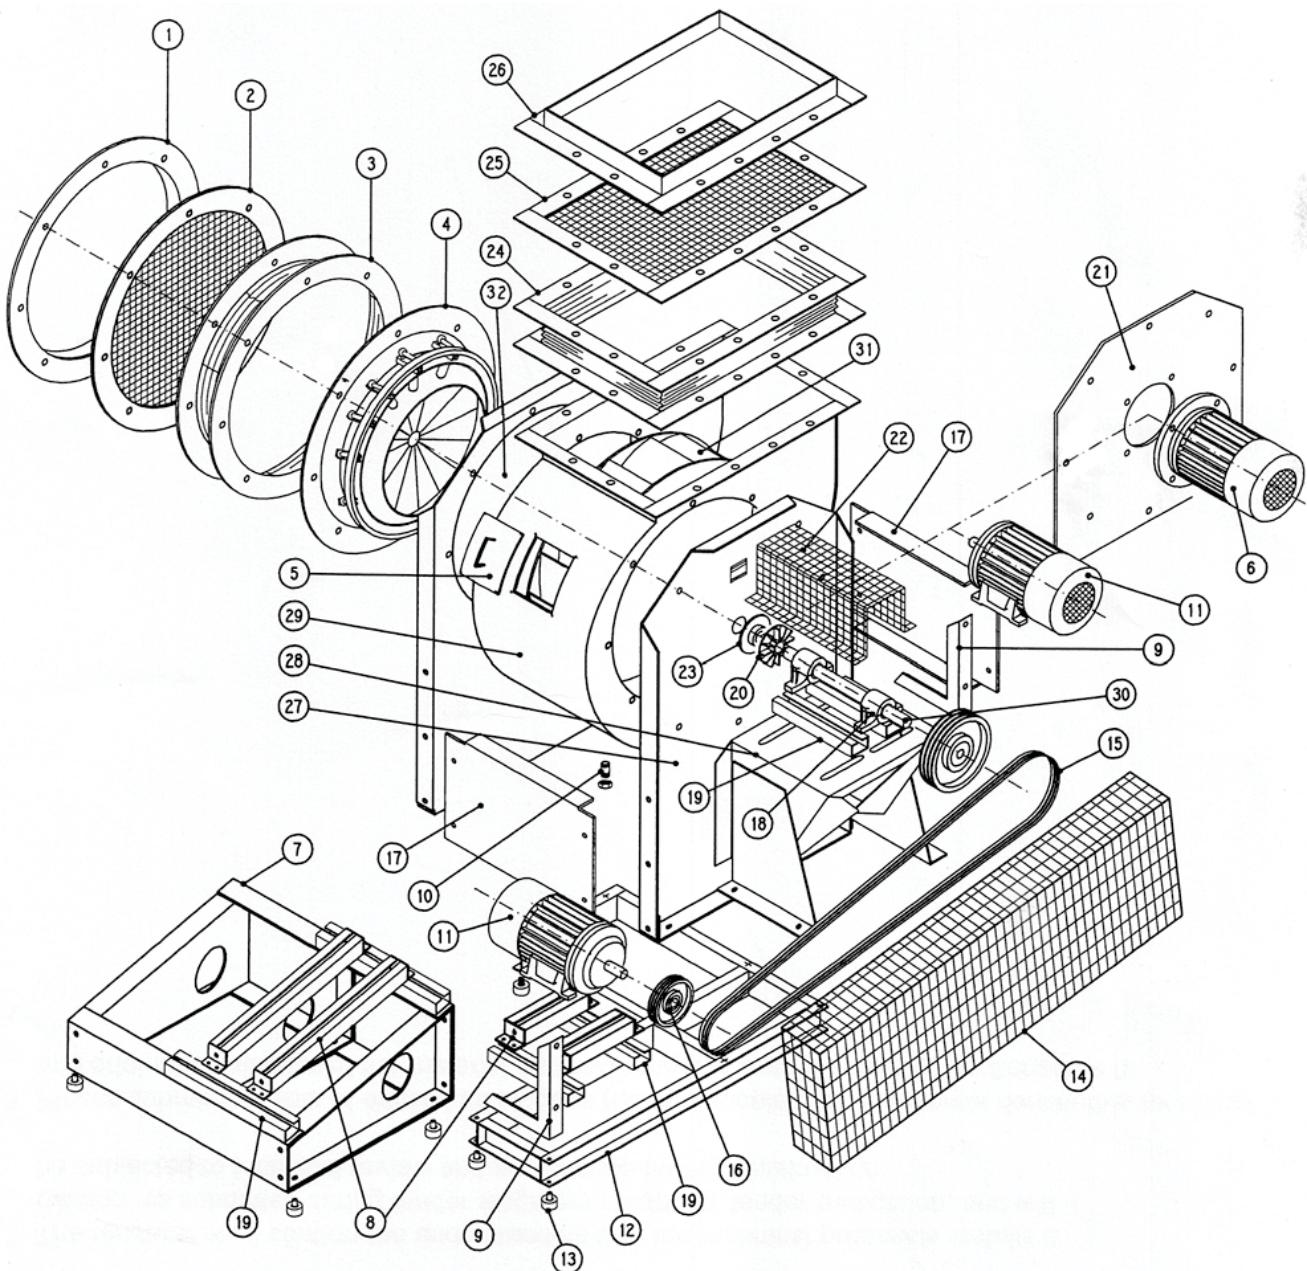

2. Prior to installation, the ventilator should be carefully inspected. Special care should be taken in checking the shaft, impeller and bearings. If there is an indication of any damage, then the damaged parts should be repaired or replaced before the ventilator is installed or operated.
3. The inside of the scroll and casing need to be checked to make sure that there are no foreign objects contained there in, such as tools or loose parts.
4. The rotational directions of the motor and impeller should be checked to assure that they are consistent with each other.
5. A flexible connector should be used between the ventilator outlet flange and its mating pipe. The bolts used to fasten the outlet flange to the pipe should not be over tightened.
6. Following the installation, the impeller should be turned by hand or with the use of a wrench to make sure that it turns freely. Once this is verified, the ventilator can be operated normally.
7. The rated motor power as calculated here in is not sufficient to drive the ventilator with an unrestricted discharge flow path. Operating the ventilator with an unrestricted discharge flow path will result in flow rates that exceed the ventilator flow rate capabilities, and such operation will quickly burn out the motor. So care must be taken in operating the ventilators to make sure that the maximum rated flows, as provided on the performance chart in this brochure, are not exceeded.
8. This fan is restricted for use in areas where air substances are non-corrosive and non-toxic, non-alkaline or where dust particles $<150\text{mg/m}^3$, $-20^\circ\text{C} < \text{temperature} < 85^\circ\text{C}$. If special conditions during transportation, load and unload, It is strictly prohibited to Shock the ventilators.

Example Of Curve Reading

Volume	$V=8500 \text{ m}^3/\text{h}$
Total Pressure	$P_t=2060 \text{ Pa}$
Dynamic Pressure	$P_d=70 \text{ Pa}$
Outlet Velocity	$C=10.8 \text{ m/s}$
Speed	$n=2265 \text{ r/min}$
Impeller Tip Speed	$U_2=61 \text{ m/s}$
Inner Power	$N_{in}=7.1 \text{ kW}$
Sound Power Level	$L_{wi A}=94.4 \text{ dB(A)}$
Total Pressure Efficiency	$\eta = 70.5 \%$

DOUBLE INLET CENTRIFUGAL VENTILATORS WITH BACKWARD WHEELS

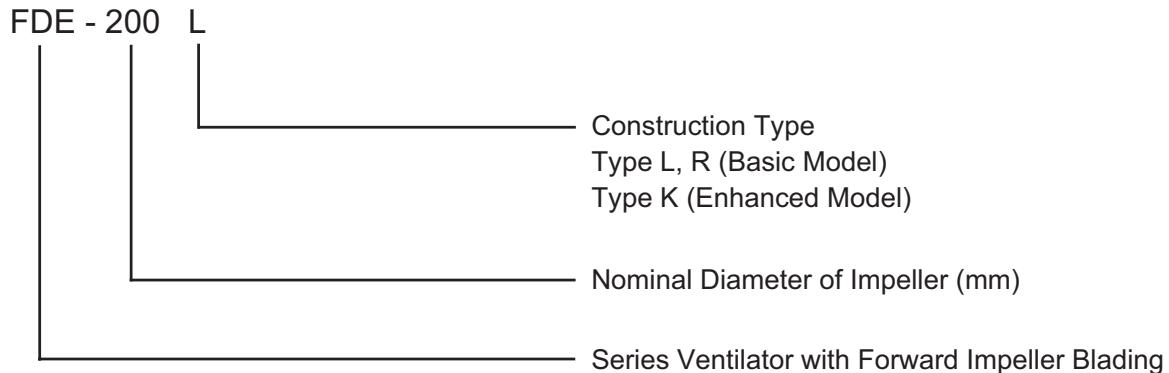

Outline

The FDE series of centrifugal fans with backward blade was developed by using international advanced technologies. They are licensed to bear the AMCA Seal. The FDE Series includes 15 models as described in this brochure. The volume flow ranges of the FDE Series varies from 1,000 cubic meters per hour to 120,000 cubic meters per hour. and pressure range from 200 Pa to 3,000 Pa. Some of the features and characteristics of these ventilators are: backward impeller blading, a wide range of applications, high efficiency, low noise, and low power consumption. These ventilators are ideal for use in central air conditioning systems, heating and ventilating air conditioning systems, and in purifiers. They are also suitable for use in a number of other ventilator applications.

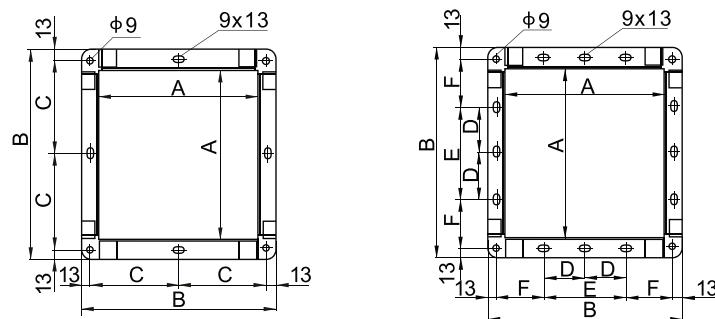

Designation of Products

The model designations signify the nominal impeller outside diameters :

Director

E-mail : seaconeng@yahoo.com

Specialize in:
HVAC Equipment Manufacturer
Marine Offshore Design
Engineering Design
Engineering Drawing

Specialize in HVAC Manufacturing:

- Air-Cooled Condensing Unit
- Chillers Unit
- Package Unit
- Stainless Steel AC Unit
- Ex-Proof Unit
- Custom-made AC unit

From Marine to Industrial to Commercial
air conditioning unit. We provide you the
best support and designs to your needs.
